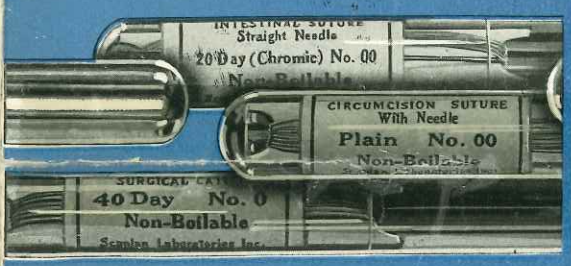
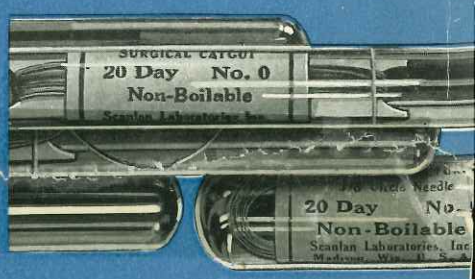
SCANLAN SUTURES

SCHEDULE
OF TYPES AND SIZES

AUGUST
1936





The excellent physical and physiological qualities of Scanlan sutures are secured through meticulous processing of selected raw material. Sterilization is by the scientific application of high heat which constitutes an important factor of safety in the use of catgut. Elaborate bacteriological tests routinely follow each sterilization period and verify results of the sterilizing process.

Scanlan catgut sutures {NON-BOILABLE} are ready for use direct from the sterile tube. Delightfully flexible, amply strong, and pleasant of texture, they require no extra handling prior to use. The tubes of catgut are stored in a germicidal solution in the operating room; the nurse removes the suture from the sterile tube as required, stretches the strand to full length and threads to needle.

SCANLAN *Needle* SUTURES

These distinctive types of needle sutures are proving wonderfully convenient for specific purposes of surgery. The needle is made from high grade needle steel, sized, shaped, and pointed according to carefully detailed specifications to meet precisely the surgeon's requirements in the various surgical procedures for which each needle is intended. Curved needle shanks are slightly flattened to prevent turning in the needle holder. The swaged-on types present a smooth, level connection of suture and needle that minimizes trauma.
